

Does climate affect salinity in SF Bay?

Salinity (the amount of salt in the water) vs sample number/visitor #. The orange dot is the salinity collected from mid-tide, the green is from low-tide (lower salinity) and the blue is from high-tide (higher salinity). For all of those samples, the salinity was lower than in the recent dry (drought) years (lines at top of graph). With these data in mind, how would you answer the research question?
